Dimension-six top-Higgs interaction and its effect in collider phenomenology

Koji TSUMURA (Osaka Univ.)

with S. Kanemura (Univ. of Toyama) and D. Nomura (KEK)

APS-DPF2006+JPS2006… , Sheraton Waikiki Hotel, Honolulu, Hawaii Oct. 29-Nov. 3, 2006

This talk is based on Phys. Rev. D 74, 076007 (2006) .

Motivation

- • **Why the top ?**
	- – **Large Y t is essentially important at future colliders.** The main H production at LHC is gluon fusion via the top- loop.
	- **Why the top exceptionally heavy ?**

Top Yukawa coupling @ future colliders

- **Gluon fusion**
	- $-$ Light Higgs
	- $-$ Large QCD Background
- **Associate production**
	- Light Higgs – $m_H \lesssim 150$ GeV

T. Han, T. Huang, Z. H. Lin, J. X. Wang, and X. Zhang, Phys. Rev. D 61, 015006 (2000)

- **W boson fusion**
	- –Heavy Higgs

Effective theory approach

Effective Lagrangian below the new physics scale – $\mathcal{L}^{\text{eff}} = \mathcal{L}_{\text{SM}} + \mathcal{L}_{\text{dim.6}} + \mathcal{L}_{\text{dim.8}} + \cdots$

$$
\mathcal{L}_{dim.6} = \frac{1}{\Lambda^2} \sum_i C_i \mathcal{O}_i
$$

The non-SM int. is characterized by dim.6 operators at leading order.

Dimension-six top-Higgs interaction

$$
\mathcal{O}_{t1}=\left(\mathsf{\Phi}^{\dagger}\mathsf{\Phi}-\frac{v^2}{2}\right)\left(\bar{q}_Lt_R\tilde{\mathsf{\Phi}}+\text{h.c.}\right)
$$

W. Buchmuller and D. Wyler, Nucl. Phys. B268, 621 (1986)

- Modefy the relation between m_t and Y_t .
- m_t renormalization is taken into account.

$$
\mathcal{O}_{Dt} = (\bar{q}_L D_\mu t_R) \left(D^\mu \tilde{\Phi} \right) + \text{h.c.}
$$

• Covariant derivatives introduce gauge int. and energy dependence.

Constraint on dimension-six operators

Links of the Company Perturbative unitarity

G. J. Gounaris, D. T. Papadamou, and F. M. Renard, Z. Phys. C 76, 333 (1997)

$$
|C_{t1}| \le \frac{16\pi}{3\sqrt{2}} \left(\frac{\Lambda}{v}\right)
$$

- 6.2 \le C_{Dt} \le 10.2

- **Direct search** K. i. Hikasa, K. Whisnant, J. M. Yang, and B. L. Young, Phys. Rev. D 58, 114003 (1998)
	- No experimental bound for C_{t1} .
	- \cup Dt can be constrained by Tevatron. for $\int \mathcal{L} dt = 100$ fb⁻¹.

$$
\left\{\begin{array}{ccc}\nW^* & & & \overbrace{00} & & t \\
\hline\n\end{array}\right.
$$

– **Indirect search**

G. J. Gounaris, F. M. Renard, and C. Verzegnassi, <u>Phys. Rev. D 52, 451 (1995)</u>

 \mathcal{O}_{Dt} can give contributions to rho-parameter. Heavier Higgs boson can be allowed in the SM-like situation with C_{Dt} .

$$
\Delta \rho_{Dt} \sim -\frac{N_c}{16\pi^2} \left(\frac{m_t^2}{\Lambda^2}\right) \left\{-\frac{\sqrt{2}m_t}{v} C_{Dt} \ln \frac{\Lambda^2}{m_t^2} + C_{Dt}^2\right\}
$$

Ex. $m_H = 500$ GeV corresponds $C_{Dt} \sim 1.5$ with $\Lambda = 1$ TeV.

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 5/13

Effects of dimension-six coupling

Links of the Company Effective top-Yukawa coupling

$$
y_t^{\text{eff}}(-q^2, \Lambda) = y_t^{\text{SM}} - v^2 \frac{C_{t1}}{\Lambda^2} - q^2 \frac{C_{Dt}}{2\Lambda^2}
$$

- $y_t^{\text{SW}} \sim 1$ which is restricted by m_t .
- Dim.6 couplings are only constrained by unitarity, its allowed values can reach $|y_{t1}, dt| \sim 3$ under the unitarity bounds.

and the state of the **Decay width for Higgs boson**

- At the tree level, top-pair production $H \to tt$ can be modified.
- Loop induced decays can be enhanced.- 10

W boson fusion

- At the high energy LC, W-fusion is an important probe.
- A few thousands of top-pair events produced via vector boson fusion.
- BGs have been studied.

Effective W approximation (EWA)

 W-bosons are treated as a parton which are emitted by initial electron and positron.

$$
\sigma(e^-e^+ \to W^-W^+\nu\bar{\nu} \to t\bar{t}\nu\bar{\nu}; \sqrt{s})
$$

= $\int_{m_W/E}^1 dx_1 \int_{m_W/E}^1 dx_2 f_{e/W_\lambda}(x_1) f_{e/W_{\lambda'}}(x_2) \sigma(W^-W^+ \to t\bar{t}; \sqrt{\hat{s}})$

- At the leading order, parton distributions for W_L consists with approximation $p_T \ll \sqrt{s}$.
	- The validity of EWA will be shown by using the package CalcHEP.
- **At first, we discuss sub-process** $W^-W^+ \rightarrow t\bar{t}$

$W^-W^+ \rightarrow t\bar{t}$ with dimension-six operators

Cutoff scale \bigwedge is set to be 1TeV.

- Dim.6 couplings can change the cross sections by a factor.
- Since Higgs decay width grow wider, cross sections can be enhanced not only the sub-process energy equal to $\rm m_H$ pole.

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 9/13

Equivalence theorem (ET)

- • **Our calculations can be checked by ET.**
	- $-$ S-matrix for W_L scattering is equivalent to those for NG-boson up to m/E. Dotted curves indicate the process $\omega \omega \rightarrow t\overline{t}$.

$$
\boxed{\mathcal{M}(W_L W_L \to t\bar{t}) \simeq \mathcal{M}(\omega \omega \to t\bar{t}) + \mathcal{O}(m_W/\sqrt{s})}
$$

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 10/13

Total cross sections $\sigma(e^-e^+ \rightarrow W^-W^+\nu\bar{\nu} \rightarrow t\bar{t}\nu\bar{\nu}$

- Solid $\Lambda = 1$ TeV, dotted
- We only impose cut $M_{t\bar{t}} \geq 400$ GeV.
-
- The total cross section can be enhanced by factor of 2 in the range $400 \text{GeV} \le m_H \le 500 \text{GeV}$.
- The effects of \mathcal{O}_{Dt} become large for heavier Higgs compare to those of \mathcal{O}_{t1} .

The validity of EWA

Dotted curves are calculated by using the package CalcHEP.

• The EWA results agree with those of CalcHEP in about 20- 30 % error for heavier Higgs boson. A. Pukhov, hep-ph/0412191

At the ILC with \sqrt{s} = 500GeV, and $\int \mathcal{L} dt$ = 500fb⁻¹, several **hundred events are expected. Statistical error is less than 10 %. Therefore the effect of dim.6 couplings can be observed.**

Summary

We discuss the W-fusion with the non-SM Y_t which are characterized by dim.6 operators. e^-

$$
y_t^{\text{eff}}(-q^2,\Lambda) = y_t^{\text{SM}} - v^2 \frac{C_{t1}}{\Lambda^2} - q^2 \frac{C_{Dt}}{2\Lambda^2}
$$

They are constrained by experimental data and unitarity.

- Our calculations have been checked by ET.
- The W-fusion has been analyzed by EWA and CalcHEP.

Conclusion

• Dim.6 couplings can enhance $\sigma(e^-e^+ \to W^-W^+\nu\bar{\nu} \to tt\nu\bar{\nu}$

At the ILC with \sqrt{s} = 500GeV, and $\int \mathcal{L} dt$ = 500fb⁻¹, several **hundred events are expected. Statistical error is less than 10 %. Therefore the effect of dim.6 couplings can be observed.**

Feynman rules

•**Feynman rules for dimension-six operators.**

Origin of dim.6 operators

•**MSSM (with the light lightest Higgs boson)**

$$
\mathcal{L}_{dim.6} = \frac{1}{M_A^2} \sum_i C_i \mathcal{O}_i
$$
\n
$$
C_{t1} = \frac{g^2 + g'^2}{2} \text{Re}(h_U^{33}) s_\beta c_\beta^2 (c_\beta^2 - s_\beta^2), \ C_{Dt} = \cdots
$$

PRD69,115007 Feng, Li, Maalampi

- • **Little Higgs, Extra dim., Top color, etc.**
	- These models can also include the structure of 2HDM, dim.6 couplings can occur.

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 15/13

Unitarity bounds

•**Amplitudes**

$$
i\mathcal{M}^{t\bar{t}\to t\bar{t}} \sim \frac{i}{s - m_h^2} \left(\frac{m_t}{v} - \frac{v^2}{\sqrt{2}} \frac{C_{t1}}{\Lambda^2} + \frac{s}{\sqrt{2}} \frac{C_{Dt}}{\Lambda^2} \right)^2 \bar{v} u \bar{u} v + \cdots
$$

$$
i\mathcal{M}^{t\bar{t}\to hh} \sim \frac{1}{s - m_h^2} \left(\frac{m_t}{v} - \frac{v^2}{\sqrt{2}} \frac{C_{t1}}{\Lambda^2} + \frac{s}{\sqrt{2}} \frac{C_{Dt}}{\Lambda^2} \right) (-i\lambda) \bar{u} v 3! + i \frac{C_{t1}}{\sqrt{2}} \frac{v}{\Lambda^2} \bar{u} v 2!
$$

–Imposing unitarity @

$$
|C_{t1}| \le 8\pi \left(\frac{\Lambda}{v}\right), \ |C_{Dt} + \frac{\sqrt{2}m_t}{v}| \le \sqrt{8\pi}
$$

–Considering 2-body scattering channels (hh, $W_L W_L$, $Z_L Z_L$, and t anti-t), chirality and color factors, then we obtained

$$
|C_{t1}| \le \frac{16\pi}{3\sqrt{2}} \left(\frac{\Lambda}{v}\right)
$$

- 6.2 \le C_{Dt} \le 10.2

$$

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 20/13

Sub-process cross section vs dimension-six couplings

•Cross sections for the sub-process $W^-W^+ \to t\bar{t}$

Dim.6 coupling can give negative contributions.

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 21/13

Equivalence theorem

•**Our calculations can be checked by equivalence theorem.**

– S-matrix for longitudinally polarized W boson scattering is equivalent to those for NG-boson up to mass/energy. Dotted curves indicate the process $\omega \omega \rightarrow t\bar{t}$.

$$
\mathcal{M}(W_L W_L \to t\bar{t}) \simeq \mathcal{M}(\omega \omega \to t\bar{t}) + \mathcal{O}(m_W/\sqrt{s})
$$

• BRS identity

$$
\partial^\mu W_\mu^\pm - i m_W^{} \omega^\pm = 0
$$

• Equivalence between longitudinal pol. and scalar pol. at high energies.

$$
e_S^{\mu} = \frac{1}{m_W} p^{\mu} = \gamma_W(1, 0, 0, \beta_W), \ e_L^{\mu} = \gamma_W(\beta_W, 0, 0, 1)
$$

$$
\gamma_W = \frac{\sqrt{s}}{2m_W}, \beta_W = \sqrt{1 - \frac{4m_W^2}{s}}
$$

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 22/13

Unitarity cancellation

- In the SM, the amplitude for WW scattering does not divergent at high energies due to unitarity cancellation.
- The effects of dimension-six operator \mathcal{O}_{Dt} rapidly grow higher energy.
- However, the SM-like unitarity cancellation can take place, the total cross section is stabilized up to the cutoff scale.

APS-DPF2006+JPS2006 Oct. 29-Nov. 3 Koji TSUMURA 23/13

Total cross section vs dimension-six couplings

•Total cross section for the process $e^-e^+ \to W^-W^+\nu\bar{\nu} \to t\bar{t}\nu\bar{\nu}$
